

Application

The Redwater™ Diverter is a small valve that is installed close to an area where hot water is used, like your kitchen and bathroom. The Redwater™ Diverter can service a single tap - like your kitchen sink, or multiple taps close together - like your bathroom.

The most obvious is the kitchen sink where hot water is often used throughout the day.

Commonly, the water must travel a long distance to reach the outlet.

For optimum water savings, the Redwater™ Diverter could be installed in the cupboard below the control valve (tap) offering maximum saving, with only the smallest amount of "cooled water"/Redwater™ being discarded.

The Redwater™ Diverter could also be positioned under the floor, in the ceiling space, or in a commercial situation in service ducts provided.

Another example of a high usage area is the bathroom. In this case the Redwater™ Diverter could be installed to service multiple fixtures such as the shower, bath and basin, or individually only to the shower.

The Redwater™ Diverter can be installed upstream from any fixture where hot water is required.
